**Software Engineer, Hermes Cloud | Nous Research**

## Cover letter

Hi Nous Research team,

I've thought of myself as a technomancer since I was a kid. Technology felt like magic, and I wanted to learn enough to make it useful for people. Hermes Cloud caught my attention because it puts two kinds of work together that I like doing: making the product easier to use and making the systems behind it easier to run.

At Front Range Internet, I moved hosted workloads from Hyper-V and VMware ESXi into Docker and Kubernetes and worked hands-on with AWS. I ran the NOC and handled the issues it escalated. That taught me to think about what someone needs when a release breaks: which version is running, what changed, how to check recovery, and where to look next.

At Technomancy IT, I built a TypeScript and PostgreSQL platform for client operations. I built release tooling that tags images from Git, applies database migrations and checks health after deployment. I also built a separate restore-verification workflow so we could actually test a backup. On the agent side, I've built access-controlled MCP and SaaS integrations, where I think about what a tool can see and do before giving it more responsibility.

I'd bring application engineering, operational ownership and practical agent-tooling experience to Hermes Cloud. I'd like to learn how your team runs managed inference and agent execution today, and help build the parts that let Research and Product ship changes with confidence.

Thanks,
Chad Koslovsky
